

AUGUST 2005

Another Step Towards **Safety** Facet's New Fuel-Gard® Monitor Cartridges

We are pleased to announce that Facet has fully qualified our *new* **FG-2xx-4** monitor elements to the latest API/IP 1583 4th edition which includes the addendum dated 2nd April 2005. In addition, knowing that API/IP has concluded that a major source of problems for some existing monitor elements is the salt concentration in fuels, we took this qualification opportunity to include the proposed API/IP 1583 5th edition salt water injection requirements which we successfully passed.

The only changes from our FG-2xx-3 3rd edition qualified monitor elements are the end caps, center tube and adhesive, which have **antistatic** properties. The media remains the same. Visually, the only differences you'll see are the *new* conductive end caps are **black** instead of the **red** used for the 3rd edition monitor elements.

Within the next few weeks, you'll receive notification that we are replacing all orders for our FG-2xx-3 with our *new* **FG-2xx-4**. It's important to note that *you'll be able to interchange these elements and use both in the same vessel at the same time.*

Facet's product development team is constantly working to develop the most advanced filtration products available for our customers. We are excited about new state of the art absorbent materials currently being tested for the proposed 5th edition. Recent testing has been very promising; we'll keep you posted on test results.

Our Goal...Develop the most reliable long life monitor element in the history of aviation filtration.
